

Peratec Fungicide-Tomatoes

Powdery Mildew

Peratec Fungicide utilizes peroxygen chemistry that is specific for agricultural field crops as well as greenhouse productions and post harvest storages. This is a new tool to fight against disease caused by fungi and microbial plant pathogens that will not leave toxic residues on the surface of the plant nor will it harm the environment or pose risk to human health and safety. It is a clear non-foaming biodegradable sanitizer for use on fruit and foliage, extremely effective as a fungicide on Botrytis and other fungal infections at a dilution rate of 1:100.

BENEFITS:

- Extremely effective against a wide range of contaminants including Aerobic and Anaerobic bacteria, spores, yeast, mould, fungi and other viruses.
- Particularly effective in controlling the growth of organisms which are propagated by spores, and can be advantageously be used in control without resulting in the evolution of a resistant strain of the organism.
- Minimal contact time required 10 to 30 minutes depending on the degree of infection.
- Optimum efficiency obtained at a dilution rate of 1:100 to 1:500.
- Produces a dramatic reduction in laccase levels in must.
- Safe on newly grafted plants. Contains no surfactants.
- Safe on stainless steel plant and equipment.
- **Non-Residual**, fruit can be sprayed right up to harvest date, leaves no lingering taste or smell..
- Spray volume 600-1500L/hectare.
- Cost effective in use, 2.5/L of Peratec Fungicide to 500L of water.
- Environmentally friendly.

Directions For Use

Tomatoes	Anthrachnose	1:100	Curative: Spray diseased plants using a 1:100 rate, then spray at five to seven day intervals to break the spore cycle. Preventive: Begin when plants are small. Apply first three treatments at 1:100, at 5 day intervals. Reduce rate to 1:300 after the completion of third treatment and maintain 5-days interval spray cycle until harvest.
	Cladosporium Mold		
	Early Blight		
	Late Blight	1:100	
	Powdery Mildew	1:300
